#ER overview: How do we identify training needs in Ecological Restoration?

TRAIN#ER aims to achieve a shared model for vocational training needs in Ecological Restoration (ER), based on a common analysis of knowledge production and use in the participating countries and a final joint definition of recommendations.

Implemented by a consortium of 8 organizations, TRAIN#ER will identify knowledge from educators and users, detect gaps in knowledge production and transfer, and contribute to designing effective vocational training programs that integrate the specificities of the different socio-ecological systems, scientific and technical skills, including language, inclusion and cultural barriers.
